

Don't Let Your Water System Run You.

By leveraging the latest technology in distributed automated systems, Unified Data Corporation is able to provide our customers with a state-of-the-art solution that allows end-users to remotely monitor, control, and diagnose their systems over the web.

Watching Your Water All Day Every Day

Our systems provide 24-7 monitoring of your facilities and alert you of any abnormalities or problems as soon as they occur. By knowing immediately of any problems with your system, small problems can be pin-pointed and repaired before they escalate into costly bigger problems.

Reporting for Duty...

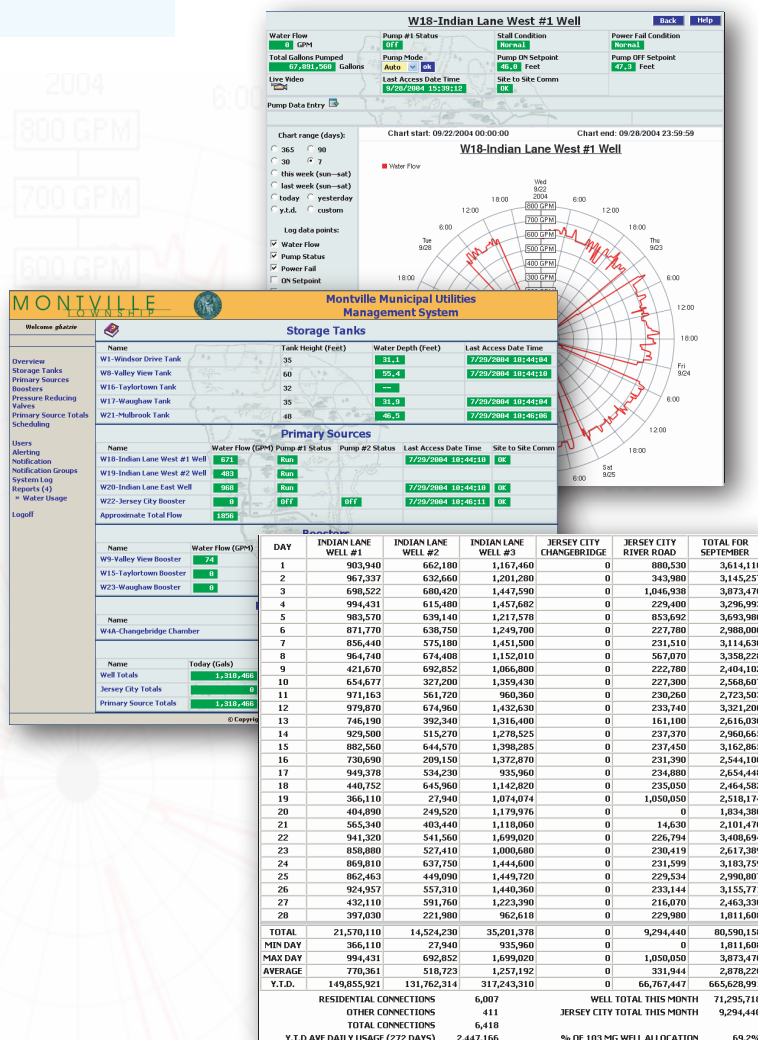

Automatic report generation takes the drudgery out of preparing reports. Data is automatically collected by the system and populated in the reports. Our integrated reporting features make generating local and DEP reports a snap!

Your Data is History!

Historical data access provides users with the ability to generate graphs and export data as spreadsheets with ease.

Scheduling with the Click of a Mouse

With the Utilities Management System you can create versatile schedules for your equipment. These schedules automatically control your hardware and provide accurate system operation.

“The wealth of useful information that comes from UDC by way of monitoring and control is the only way to go for water management now and in the future. ”

Tom Mazzaccaro
Director, Montville Water and Sewer Department
